How to Strengthen Program Implementation at Scale: 
EVIDENCE FROM NIGERIA
September 2017

The UNICEF Community Infant and Young Child Feeding (C-IYCF) 
Counselling Package was first released in 2010.

Since then, it has been used in more than 50 countries. (UNICEF 2017)

Nigeria adapted and adopted the UNICEF Community Infant and Young 
Child Feeding (C-IYCF) Counselling Package, starting in 2011, and it has 
since been rolled out in many states across the country.

The Nigerian Federal Ministry of Health (FMOH) partnered with SPRING 
and UNICEF to assess four domains related to implementation the 
package.

Using mixed methods, this team has evaluated at-scale 
implementation in Kajuru Local Government Area (LGA).

Many groups have been involved in rolling it out across the country.

Domains Assessed: Nigeria C-IYCF Counselling Package

- Caregivers' knowledge, attitude, beliefs, and practice related to MNCH
- Skills and knowledge of MNCH service providers
- Program processes, implementation, achievements, and cost
- Contextual and environmental factors that enable or hinder success

Evaluation Design

Key informant interviews
Maternal surveys
Community leader surveys
Community worker assessments
Health worker assessments

Costing exercise

This document is made possible by the generous support of the American people through the United States Agency for International Development (USAID) under the terms of the Cooperative Agreement AID-OAA-A-11-00031 (SPRING), managed by JSI Research 
& Training Institute, Inc. (JSI) with partners Helen Keller International, the Manoff Group, Save the Children, and the International Food Policy Research Institute and by funding and technical support from the United Nations Children’s 
Fund (UNICEF) with leadership of the Federal Ministry Health (FMOH) of Nigeria. The contents are the responsibility of JSI, UNICEF, and the FMOH of Nigeria and do not necessarily reflect the views of USAID or the United States Government.
The evaluation found significant changes in maternal, infant, and young child nutrition knowledge, attitudes, and practices. Improvements were greater in Kajuru than Kauru.

Pregnant women learned and believed in eating more during pregnancy. While those who actually ate more during pregnancy increased, less than half reporting doing so at endline.

Among mothers, there were impressive improvements in breastfeeding knowledge, attitudes, and practices. However, there is still room for improvement.

We observed a decline in dietary diversity among children 6-24 months old, but it was significantly more pronounced in Kauru than in Kajuru.

Among mothers, while there were improvements in knowledge, attitudes, and confidence related to the introduction of complementary foods. They learned that it is best to start feeding children solid, semi-solid, or soft foods when they are six months old; however, the practice remained constant.

They learned which foods were rich in iron and Vitamin A, but were not able to feed their children those foods.

38.6% of mothers thought that breastfed children under six months old should be given water if the weather is hot at endline.

60.7% thought that you should wait until a child is a year old before feeding her animal source foods.
