In pregnancy, infections are a key cause of anemia and can be prevented by sleeping under a bednet and taking intermittent preventive treatment (IPTp) for malaria and deworming pills.

In pregnancy, anemia can be prevented by taking iron folic acid (IFA) supplements.

In 2014, only about half of pregnant women in Lesotho consumed 90 or more IFA tablets (51.4%)

Most households have access to an improved water source (83.6%, 2014)

66.9% of infants 0-5 months are exclusively breastfed during the first 6 months after birth (2014)

In 2014, 40.5% of children 6-23 months of age consumed foods rich in iron

7.5% of married adolescent girls expressed an unmet need of family planning (2014)

In 2014, only about half of pregnant women in Lesotho consumed 90 or more IFA tablets (51.4%)

Most households have access to an improved water source (83.6%, 2014)

66.9% of infants 0-5 months are exclusively breastfed during the first 6 months after birth (2014)

In 2014, 40.5% of children 6-23 months of age consumed foods rich in iron* 

7.5% of married adolescent girls expressed an unmet need of family planning (2014)

*A includes meat, fish, poultry, and eggs: percentage who consumed foods rich in iron in last 24 hours

A multisectoral approach to prevent anemia will save lives and improve the wellbeing of mothers, infants, and children.
Anemia has substantial negative effects on the health and economic wellbeing of nations and communities. Children with anemia experience irrevocable cognitive and developmental delays and exhibit decreased worker productivity as adults. Globally, maternal anemia increases the risk of pre-term delivery and low birth weight, and iron-deficiency anemia underlies 115,000 maternal deaths and 591,000 perinatal deaths each year.

Prevalence of anemia among children 6-59 months and women 15-49 years, by province

The DHS hemoglobin levels used to diagnose anemia in children 6-59 months in grams/dL are: Mild 10.0-10.9; Moderate 7.0-9.9; Severe <7.0; Any <11.0.

The DHS hemoglobin levels used to diagnose anemia in non-pregnant women 15-49 years of age in grams/dL are: Mild 10.0-11.9; Moderate 7.0-9.9; Severe <7.0; Any <12.0.

Status of Policies or Strategies to Support Reductions in Anemia

- IFA for pregnant women
- IFA for women of reproductive age
- IFA for adolescent girls
- Micronutrient powders for children
- Indoor residual spraying
- National policy on sanitation
- IPTp for pregnant women
- Malaria diagnosis and treatment
- Long-lasting insecticidal nets (LLINs) for household use
- Deworming for children
- Deworming for pregnant women
- Breastfeeding
- Iron and/or folic acid fortification legislation
- Dietary diversity for complementary feeding

* Information from the Global database on the Implementation of Nutrition Action (GINA) or country documentation. The status of policies and strategies have been identified to the best of our knowledge. Revisions and updates are welcome.

1 Not part of national malaria strategy due to low prevalence of malaria during pregnancy.

Evidence-informed WHO guidance can be found here: http://www.who.int/elena/en/
Anemia is a Preventable Condition—Simple Interventions Can Have a Huge Impact

Increase iron uptake and stores

IFA supplementation for 90+ days increased among pregnant women

Few children 6-23 months old were fed according to 3 key Infant and Young Child Feeding (IYCF) practices 2014

- Breast milk, milk, or milk products
- 4+ food groups
- Minimum meal frequency
- All 3 IYCF practices

Reduce iron losses and infection

Access to an improved water source during both the dry and rainy season has improved from 2010-2014

The percentage of children 6-59 months receiving deworming medication more than doubled since 2009

Exclusive breastfeeding of children <6 months has increased from 2007 to 2014

The percentage of households with an improved latrine has doubled since 2009

All data is from Lesotho Demographic and Health Surveys unless otherwise noted.

*Definition of 'improved drinking water source' has changed slightly across years. See Demographic and Health Surveys.

*Definition of 'improved latrine' has changed slightly across years. See Demographic and Health Surveys.

*Definition of 'deworming medication given in past 6 months for children and during last pregnancy for women.
Multiple Sectors Play a Role in Anemia Prevention and Treatment

Stunting and anemia share similar risk factors and are responsive to many of the same interventions

**Agriculture**
- Increase income and reduce poverty
- Production of biofortified and iron-rich crops
- Small livestock/poultry
  - Fisheries
- Dietary diversity

**Health**
- Iron supplementation
  - Deworming
  - Breastfeeding and complementary feeding
  - Family planning
  - Malaria prevention and treatment
  - Delayed cord clamping

**Water and Sanitation**
- Improved latrines
- Handwashing
- Access to clean water
- Livestock management
  - Infectious disease prevention

**Education**
- Female literacy
- Health education
- Hygiene education
- Family planning education
- Nutrition education
